ABOUT GROUPI

Groupi is a web application that enhances and captures group learning experiences while helping students and teachers to maintain a constant communication link.

The application was created to engage students during courses with interactive tasks and evaluations allowing professors to check their students accomplishments and present their results in real-time all on a single page.

Students can search for class materials and ask questions after class when needed. The application creates a summary of every class including charts, abstracts, and media.

THE CHALLENGE

It's proven that if the student enjoys the learning process, the ability to retain new information will be enhanced. To create an innovative, engaging experience for students, Groupi needed a web app that would facilitate interactions in real time.

They wanted to establish a constant communication link and provide a tool for both, teachers and students, to get a summary on how the course is going. This would involve a large amount of data for the app to manage.

WHAT WE DID

Using our vast experience managing web and mobile applications with dynamic content, we created not only an application capable of swapping and modifying elements but also a powerful backend system designed to store thousands of files and grow when needed.

Python

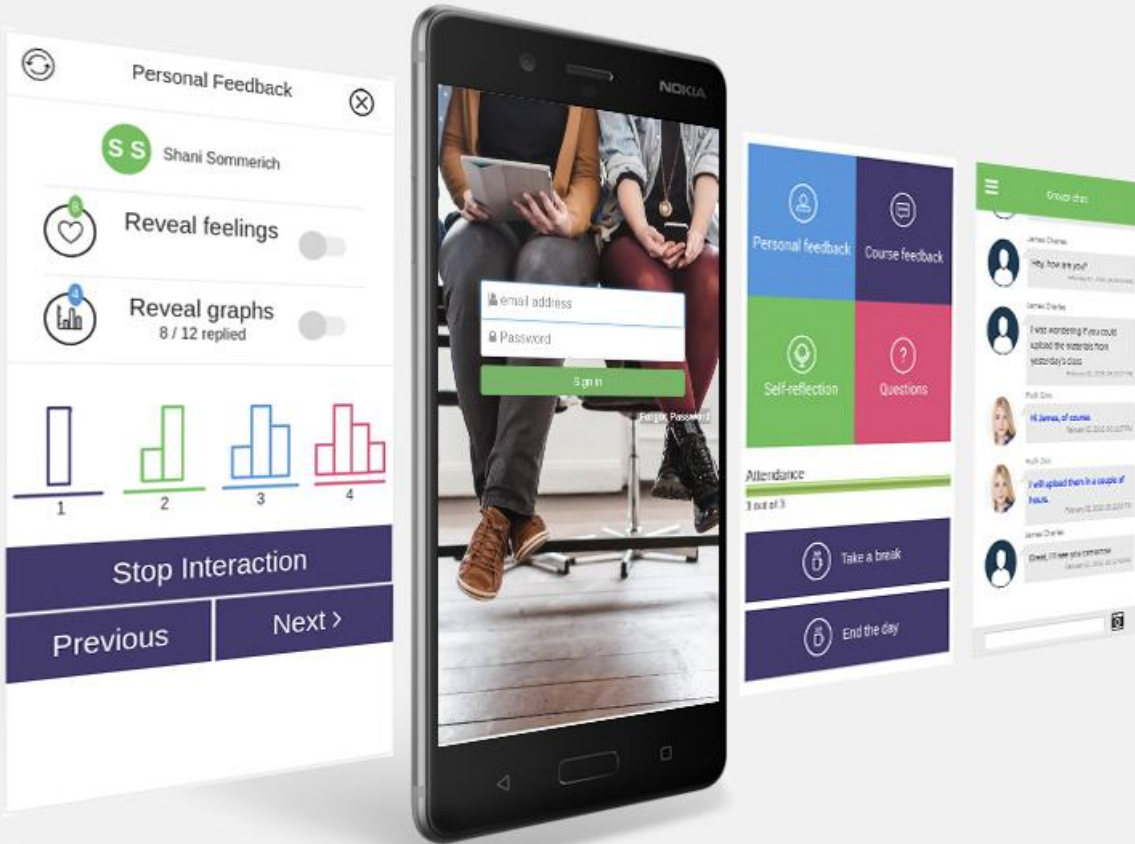

Django

AWS

Javascript

RESULTS & TAKEAWAYS

The app is used throughout various classes and conferences, generating positive feedback with both teachers and students.

Everyday more apps like Groupi are being included in the Education System changing the way professors teach and students learn. The project took 2 developers and 5 months.

“They are a really talented group of professionals that actually care about your project, always suggesting ways to improve it. I truly appreciate the team’s responsiveness and their quick answers. I’d pleasantly recommend them.”
